

TELINET SHARES TRADE SECRET FOR COMMERCIAL AND ENVIRONMENTAL EFFICIENCY; REVEALS LATEST IP EXPERTISE FOLLOWING ACQUISITIONS

IP'08, London, 1-2 October 2008 – Telinet, a converged IT and telecommunications specialist, is to showcase its newly extended portfolio of solutions and services at this year's IP'08, which ranges from unified communications and mobility through to the latest in bleeding edge data centre design.

The extension of Telinet's suite of ICT expertise comes from a series of group acquisitions, bringing a further three well-established IT and telecom organisations including Pasporte, RGT, and Evolution Voice & Data into the fold.

Simon Osman, chief operating officer at Telinet, comments; "We are now able to call upon the knowledge and wide-ranging ICT portfolios of our three sister companies. As a group, we have even greater power to ensure that our customers are benefiting from the most resilient and bespoke services and solutions, meaning they gain even more competitive advantage from their ICT strategy."

A focal point of Telinet's stand will be an interactive presentation of the latest in data centre design. The data centre, which was recently built for IT services provider, Netstore, demonstrates a number of innovative design features and trade secrets that aim to maximise commercial and environmental efficiency.

"One such secret we'll be sharing with delegates," adds Osman "is to turn the thermostat up. Most data centres are kept unnecessarily cool, as recommended by storage and UPS vendors. A data centre, however, will perform equally well at a higher temperature, and in doing so, data centre owners will see a significant reduction in their energy bill."
